

Name : Ege

Surname : özfırıncı

Studentid: 170316025

First I created classes and add set and get methods .

I defined private variables for other class.

Uni class is main class of this project .

Created arraylist for each class and created while(boolean) type loop because for the program work and not end without command .

Use scanner for take entered number or String value .

First switch loop is program body and this program have nested switch loops .

First case is Student operation second case is Instructor third case is courses operation and fourth case is listing operations.

I prefer nested switch loop because its much safe and solid and more regular.

I limited switch loop's variables with if loop.

While(boolean) loop started then main program started , at the beginning booleans are true I use scanner and if loop for control boolean variables inside. And finally I set true all booleans because if I dont do this program not work full functional.

Use iterator for almost every arraylist operations because its safe for remove and update functions also use for listing operation.
